

Information Technology

From playing video games to watching movies and listening to music I have loved computers since the first time I used one. Teaching myself how to use them, installing Windows 98 using fdisk and format/setup DOS commands, the more I learned the more I wanted to know. Moving from personal entertainment to more professional and productive uses, the thirst for knowledge never runs dry.

Experience including building a Linux PXE boot server and serving virtual machines through a web browser with both Windows Server 2008 and Centos 5 (Linux) has helped mature my abilities. During my time working in the computer lab at San Antonio College I have also used Ghost for Linux to image 20+ client machines as well as installing and configuring a Debian virtual machine with Apache, Oracle, MySQL and PHP. I installed and configured a stealth logging server with a one-way networking cable and Syslog-NG which was used on the SAC Computer Information Systems department network. The CIS computer implemented a Samba Primary Domain Controller which included roaming profiles/network shared home directories and file system quotas. The system was completely designed and implemented by me.

My dedication to IT and to my employers, both working for San Antonio College with the work study program and for a tax preparation service has earned the appreciation and respect of my employers and coworkers. Given the opportunity I have no doubts in my abilities to do the same, whom ever I may work for. Your consideration of myself for employment with your company is greatly appreciated, Thank You.

Mark Mayfield
